

## ABSTRACT

A method for assembling a motor vehicle door includes the steps of affixing a  
5 plurality of hardware components to a secondary trim component to form a door  
module assembly. The door module assembly is attached to the structural door body.  
A trim panel is secured to the structural door body overlaying the door module  
assembly. The secondary trim component has a map pocket wall and the trim panel  
has a map pocket opening. When the trim panel overlays the secondary trim  
10 component, the trim panel cooperates with the secondary trim component to define a  
map pocket.
